

WebCCTV NVR catches criminals

Brussels night store

The following movie was generated through WebCCTV NVR's permanent activity based recordings at a night shop in Brussels.

As a result of these images the two criminals were recognized and arrested. They had successfully committed hold ups on several night stores in the Brussels region before they were so unfortunate to enter a shop guarded by a WebCCTV NVR.

The hold up took place in January. As they have not yet been condemned in court the recording has been digitally modified to make their faces unrecognizable.

The recording was done through a cheap black & white camera.

AXA bank office

A robot picture as described by these shocked witnesses after a hold up at an AXA bank office.

If anybody knows the whereabouts of the brother of Pinocchio please contact the nearest police station.

Is it reasonable to expect people under duress to remember all the details that a camera recording can deliver?

Careful and repeated review of the recording might give you details unnoticed in a first review.

Confronting someone to a recording is most helpful to obtain immediate confessions.
